SEMESTER END EXAMINATION QUESTION PAPER**Second Semester MCA Degree Examination****Regular / Make-up / Arrears / Supplementary****BIG DATA ANALYTICS****Time:** 3 hrs.**Max. Marks:** 100**Note:** 1. Answer **FIVE** full questions, choosing **ONE** full question from each module.

| Q. No | Module - 1 | Marks | CO & RBT |
|-------------------|--|-------|----------|
| 1a. | What are Outliers and discuss causes of outliers | 6 | CO1, K2 |
| b. | What is Big Data? Demonstrate the working of analytical processing Model. | 10 | CO1, K2 |
| c. | Explain the different sources of Big data and Explain? | 4 | CO1, K2 |
| OR | | | |
| 2a. | Define Big Data and Characterise 5V's of Big Data. | 10 | CO1, K2 |
| b. | Construct Box plot for given data: 51,17,25,39,7,49,67,41,20,2,43,13. | 4 | CO1, K2 |
| c. | Explain the schemes to deal with missing values in a dataset. | 6 | CO1, K2 |
| Module – 2 | | | |
| 3a. | Discuss the logistic regression role in predictive analytics. | 7 | CO2, K2 |
| b. | Justify the need of having support vector machines for predictive analytics. | 7 | CO2, K2 |
| c. | Differentiate the following i) predictive analytics and descriptive analytics. ii) hierarchical and non-hierarchical clustering. | 6 | CO2, K2 |
| OR | | | |
| 4a. | Discuss various performance methods to evaluate classification models. | 8 | CO2, K2 |
| b. | Describe the role of decision trees in predictive analytics. | 7 | CO2, K2 |
| c. | Describe bagging and boosting concepts in predictive analytics. | 5 | CO2, K2 |
| Module – 3 | | | |
| 5a. | Demonstrate core architecture of Hadoop with suitable block diagram. Discuss role of each component in detail. | 10 | CO3, K2 |
| b. | Demonstrate different stages of MapReduce with an example. | 10 | CO3, K2 |
| OR | | | |

| | | | |
|-------------------|---|----|---------|
| 6a. | Analyse the anatomy of writing data into a file in HDFS with a neat diagram. | 10 | CO3, K2 |
| b. | Describe the role of combiner functions in MapReduce processing. | 10 | CO3, K2 |
| Module – 4 | | | |
| 7a. | Discuss the architecture of Spark and Spark's language APIs. | 10 | CO4, K2 |
| b. | Discuss the dataframes and datasets in Spark. | 10 | CO4, K2 |
| OR | | | |
| 8a. | Elaborate on Spark's toolset with a neat sketch. | 10 | CO4, K2 |
| b. | Bring out the importance of lazy evaluations in Spark. | 5 | CO4, K2 |
| c. | Discuss the overview of structured API. | 5 | CO4, K2 |
| Module – 5 | | | |
| 9a. | Analyze architecture of APACHE HIVE. Explain different ways of inserting/loading data to HIVE tables with example. | 10 | CO5, K2 |
| b. | Illustrate HiveQL Data definition and Data manipulation commands with example. | 10 | CO5, K2 |
| OR | | | |
| 10a. | Summarize various data types supported by HiveQL with an example. | 8 | CO5, K2 |
| b. | Design the hive solution for the following queries in HiveQL. Creating student table with USN, name of the student, year of join(yoj), course, email address, phone number and CGPA i) Find the total no of students in each course. ii) List the student who is having maximum and minimum CGPA iii) Create a view to store the details of the students whose CGPA is greater than the 9.00. iv) List the students in the ascending order of their course | 8 | CO5, K2 |
| c. | Illustrate Metastore in HIVE. | 4 | CO5, K2 |

Course Outcomes (COs): At the end of the course, the student will be able to

| COs | Statements |
|---|--|
| CO-1 | Identify the business problem for a given context and frame the objectives to solve it using data analytics tools. |
| CO-2 | Differentiate various types of analytics algorithms and context of their application. |
| CO-3 | Illustrate the architecture of HDFS and MapReduce. |
| CO-4 | Explore Spark architecture and its language APIs. |
| CO-5 | Write Hive queries against large datasets on clusters. |
| K1- Remembering K2 - Understanding K3 – Applying K4- Analyzing K5 - Evaluating K6 -Creating | |

“Success is the progressive realization of a worthy goal.”

|--|--|-----------------------|----------------------|--|--|--|--|--|---|--------------|------------------|---|--|--|---|---|
| 3 a) | <p>Explanation & examples Exp-5M, fig-2M</p> <p>Logistic regression aims to measure the relationship between a categorical dependent variable and one or more independent variables (usually continuous) by plotting the dependent variables' probability scores. A categorical variable is a variable that can take values falling in limited categories instead of being continuous. Logistic regression techniques have recently experienced a surge in demand due to the increasing use of Machine Learning, as this is one of the most commonly used algorithms. Its applications aren't limited to specific industries or use cases, making it a commonly used and flexible analytics technique <u>compared to other analytics methods</u>.</p> | 5+2 | | | | | | | | | | | | | | |
| 3b) | <p>Explanation & examples Exp-4M, fig-3M</p> <p>Non-linear SVM means that the boundary that the algorithm calculates doesn't have to be a straight line. The benefit is that you can capture much more complex relationships between your datapoints without having to perform difficult transformations on your own. The downside is that the training time is much longer as it's much more computationally intensive.</p> | 5+2 | | | | | | | | | | | | | | |

| It is very problematic to apply this technique when we have data with high level of error. | It can work better than Hierarchical clustering even when error is there. |

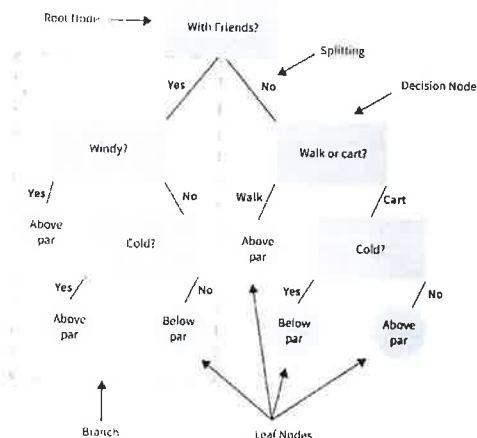

4a) Performance Evaluation Measures for Classification Models?

- Confusion Matrix
- Precision
- Recall/ Sensitivity
- Specificity
- F1-Score
- AUC & ROC Curve with examples

Expt. of only 4 - 2M each

4b) Decision trees tend to be the method of choice for predictive modeling because they are relatively easy to understand and are also very effective. The basic goal of a decision tree is to split a population of data into smaller segments. There are two stages to prediction. The first stage is training the model—this is where the tree is built, tested, and optimized by using an existing collection of data.

Expt - 4M
Pg - 3M

4c) **Bagging** is a way to decrease the variance in the prediction by generating additional data for training from dataset using combinations with repetitions to produce multi-sets of the original data. **Boosting** is an iterative technique which adjusts the weight of an observation based on the last classification. If an observation was classified incorrectly, it tries to increase the weight of this observation. Boosting in general builds strong predictive models.

Advantages:

- Reduces over-fitting of the model.
- Handles higher dimensionality data very well.
- Maintains accuracy for missing data.

Disadvantages:

Since final prediction is based on the mean predictions from subset trees, it won't give precise values for the classification and regression model.

Boosting is used to create a collection of predictors. In this technique, learners are learned sequentially with early learners fitting simple models to the data and then analysing data for errors. Consecutive trees (random sample) are fit and at every step, the goal is to improve the accuracy from the prior tree. When an input is misclassified by a hypothesis, its weight is increased so that next hypothesis is more

2 1/2 M
each

Pg 3

DESCRIPTIVE QUESTIONS PATTERN

likely to classify it correctly. This process converts weak learners into better performing model.

Advantages:

- Supports different loss function (we have used 'binary:logistic' for this example).
- Works well with interactions.

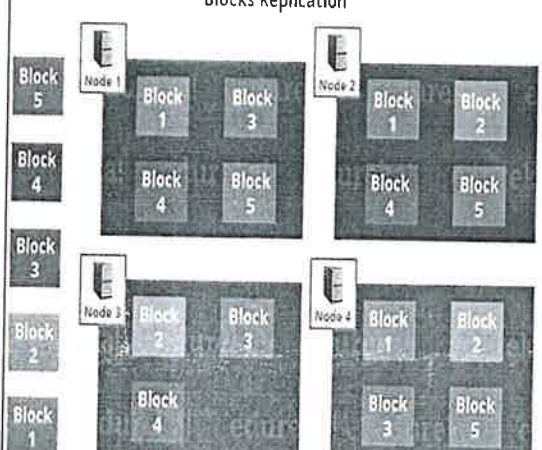

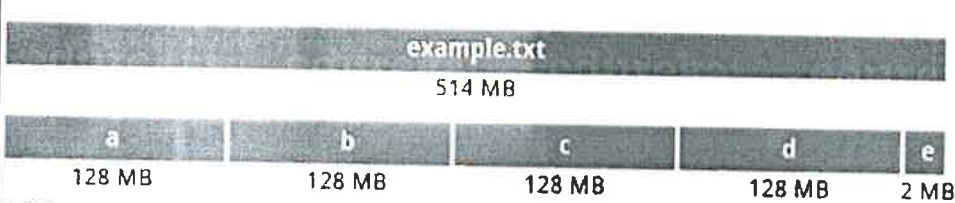

Disadvantages:

- Prone to over-fitting.
- Requires careful tuning of different hyper-parameters.

COURSE CODE: 2052 COURSE NAME BIG DATA ANALYTICS

| Q. No | Scheme and Solutions | Marks |
|-------|--|-------|
| 5 a) | <p>Blocks Replication</p>  <p>HDFS Concepts</p> <p>a. Blocks</p>  <p>2. Namenode</p> <p>Name Node is the single point of contact for accessing files in HDFS and it determines the block ids and locations for data access. So, Name Node plays a Master role in Master/Slaves Architecture where as Data Nodes acts as slaves. File System metadata is stored on Name Node.</p> <p>File System Metadata contains majorly, File names, File Permissions and locations of each block of files. Thus, Metadata is relatively small in size and fits into Main Memory of a computer machine. So, it is stored in Main Memory of Name Node to allow fast access. Tasks of HDFS NameNode (Job Tracker)</p> <ol style="list-style-type: none"> Manage file system namespace. Regulates client's access to files. Executes file system execution such as naming, closing, opening files and directories. <p>ii. Datanode</p> <p>Tasks of HDFS DataNode(Task Tracker)</p> <ol style="list-style-type: none"> DataNode performs operations like block replica creation, deletion, and replication according to the instruction of NameNode. DataNode manages data storage of the system. <p>Replication Management:</p> | 3+7 |

6a)

3+7

Fig - 3M
Expt. of Steps - 3M

Step 1: The client creates the file by calling create() method on DistributedFileSystem. **Step 2:** DistributedFileSystem makes an RPC call to the namenode to create a new file in the filesystem's namespace, with no blocks associated with it. The namenode performs various checks to make sure the file doesn't already exist and that the client has the right permissions to create the file. If these checks pass, the namenode makes a record of the new file; otherwise, file creation fails and the client is thrown an IOException. TheDistributedFileSystem returns an FSDataOutputStream for the client to start writing data to. **Step 3:** As the client writes data, DFSOutputStream splits it into packets, which it writes to an internal queue, called the data queue. The data queue is consumed by the DataStreamer, which is responsible for asking the namenode to allocate new blocks by picking a list of suitable datanodes to store the replicas. The list of datanodes forms a pipeline, and here we'll assume the replication level is three, so there are three nodes in the pipeline. TheDataStreamer streams the packets to the first datanode in the pipeline, which stores the packet and forwards it to the second datanode in the pipeline. **Step 4:** Similarly, the second datanode stores the packet and forwards it to the third (and last) datanode in the pipeline. **Step 5:** DFSOutputStream also maintains an internal queue of packets that are waiting to be acknowledged by datanodes, called the ack queue. A packet is removed from the ack queue only when it has been acknowledged by all the datanodes in the pipeline. **Step 6:** When the client has finished writing data, it calls close() on the stream.

Example - 4M

(i) Map Phase

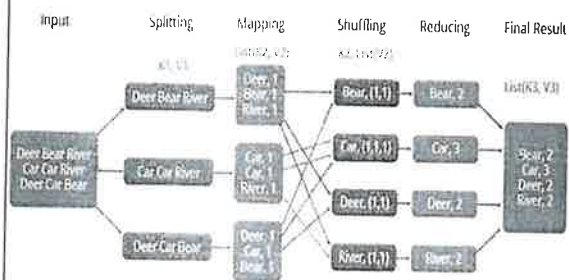

Pg 6

DESCRIPTIVE QUESTIONS PATTERN

- (ii) Combiner Phase
- (iii) Shuffle and Sort Phase
- (iv) Reducer Phase

Word count examples

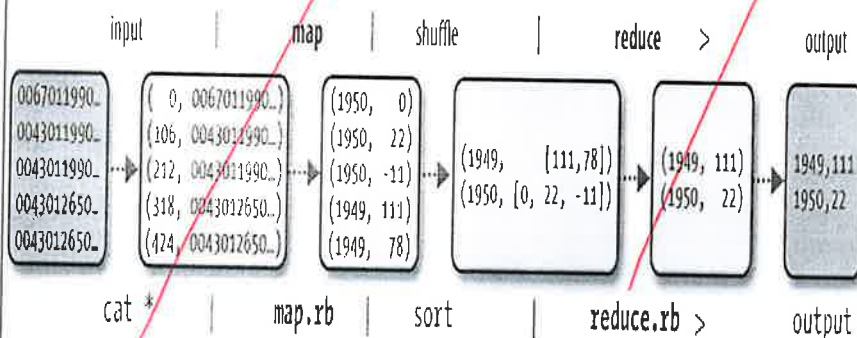

The Overall MapReduce Word Count Process

6b)

Logical Flow of Map Reduce data:

The input to our map phase is the raw NCDC data. We choose a text input format that gives us each line in the dataset as a text value. The key is the offset of the beginning of the line from the beginning of the file, but as we have no need for this, we ignore it. Our map function is simple. We pull out the year and the air temperature, since these are the only fields we are interested in. In this case, the map function is just a data preparation phase, setting up the data

Discuss the role of Combiner function in MapReduce Processing
